

## **A SMALL SAMPLING OF WHAT WE KNOW ABOUT LEARNING FROM CROSS-DISCIPLINE SCHOLARSHIP OF TEACHING AND LEARNING AND EDUCATIONAL RESEARCH**

(Handout by Kathleen McKinney, Illinois State University, [kmckinne@ilstu.edu](mailto:kmckinne@ilstu.edu))

### **Summary of some key, practical research-based knowledge about teaching/learning**

Below is a summary of some practical knowledge about teaching and learning from three sources in the literature. Note the overlap among implications across sources. A brief bibliography of other useful sources on learning is also included.

#### **What the Best College Teachers Do**

**Summary of conclusions** from Ken Bain. *What the Best College Teachers Do*. 2004. Harvard University Press. (pages 15-19). Conclusions based on intensive interviews and observations of some of the best (based on their ability to produce significant learning) teachers in the nation in higher education.

##### **1. Outstanding Teachers Know their Subjects Well**

They are active in their discipline, follow important developments within their fields, do research/scholarship, read extensively, work with colleagues...They are also able to simplify complex topics of the discipline. They had an intuitive understanding of learning and saw learning in terms of major, long-term influences on students' feelings, knowledge, and actions.

##### **2. Outstanding Teachers are Scholarly Teachers**

They treat their teaching as intellectual challenges as important as their disciplinary scholarship. They use inquiry into learning and begin with questions about student learning objectives.

##### **3. The Best Teachers Expect "More"**

They challenge students but have learning objectives that focus on learning to think and act as will be needed in life.

##### **4. The Best Teachers Create a "Natural, Critical Learning Environment"**

In this environment, students learn through the use of authentic tasks and by grappling with stimulating and important questions or problems. This environment is challenging yet supportive, and learners have a sense of control, work collaboratively, receive useful feedback for improvement, and feel they will be evaluated fairly.

##### **5. Highly Effective Teachers have a Strong Trust in Students**

They believe students want to and are able to learn. They are open and honest with students and engage in appropriate self-disclosure. They treat students with respect and caring. They do not blame students.

##### **6. Outstanding Teachers have a Strategy to Assess their Efforts and Make Changes**

The faculty members use various ways to obtain feedback on their teaching and students' learning and will adjust based on this feedback. Efforts to assess students develop from learning objectives.

#### **Seven Principles for Good Practice in Undergraduate Education**

**Direct Quote Excerpt** from Arthur W. Chickering and Zelda F. Gamson. *The American Association for Higher Education Bulletin*, March 1987.

(<http://honolulu.hawaii.edu/intranet/committees/FacDevCom/guidebk/teachtip/7princip.htm>)

"These seven principles are not ten commandments shrunk to a 20th century attention span. They are intended as guidelines... to improve teaching and learning. These principles seem like good common sense, and they are -- because many teachers and students have experienced them and because research supports them. They rest on 50 years of research on the way teachers teach and students learn, how students work and play with one another, and how students and faculty talk to each other."

#### **"1. Encourages Contact Between Students and Faculty**

Frequent student-faculty contact in and out of classes is the most important factor in student motivation and involvement. Faculty concern helps students get through rough times and keep on working. Knowing a few faculty members well enhances students' intellectual commitment and encourages them to think about their own values and future plans.

#### **2. Develops Reciprocity and Cooperation Among Students**

Learning is enhanced when it is more like a team effort than a solo race. Good learning, like good work, is collaborative and social, not competitive and isolated. Working with others often increases involvement in learning. Sharing one's own ideas and responding to others' reactions sharpens thinking and deepens understanding.

#### **3. Encourages Active Learning**

Learning is not a spectator sport. Students do not learn much just by sitting in classes listening to teachers, memorizing pre-packaged assignments, and spitting out answers. They must talk about what they are learning, write about it, relate it to past experiences and apply it to their daily lives. They must make what they learn part of themselves.

#### **4. Gives Prompt Feedback**

Knowing what you know and don't know focuses learning. Students need appropriate feedback on performance to benefit from courses. When getting started, students need help in assessing existing knowledge and competence. In classes, students need frequent opportunities to perform and receive suggestions for improvement. At various points during college, and at the end, students need chances to reflect on what they have learned, what they still need to know, and how to assess themselves.

#### **5. Emphasizes Time on Task**

Time plus energy equals learning. There is no substitute for time on task. Learning to use one's time well is critical for students and professionals alike. Students need help in learning effective time management. Allocating realistic amounts of time means effective learning for students and effective teaching for faculty. How an institution defines time expectations for students, faculty, administrators, and other professional staff can establish the basis of high performance for all.

#### **6. Communicates High Expectations**

Expect more and you will get more. High expectations are important for everyone -- for the poorly prepared, for those unwilling to exert themselves, and for the bright and well motivated. Expecting students to perform well becomes a self-fulfilling prophecy when teachers and institutions hold high expectations for themselves and make extra efforts.

#### **7. Respects Diverse Talents and Ways of Learning**

There are many roads to learning. People bring different talents and styles of learning to college. Brilliant students in the seminar room may be all thumbs in the lab or art studio. Students rich in hands-on experience may not do so well with theory. Students need the opportunity to show their talents and learn in ways that work for them. Then they can be pushed to learn in new ways that do not come so easily."

### **How People Learn**

Summary of practical implications from National Research Council. (1999). *How People Learn: Bridging Research and Practice*. Washington, DC: National Academy Press. (pages 10-17).

1. **"Draw out and work with the preexisting understandings" that students bring with them.** These ideas and conceptions about the world and how things function must be "engage" or students will likely have difficulty understanding new information and concepts beyond surface short-term learning.
2. **"Teach some subject matter in depth, providing many examples in which the same concept is at work..."** Research demonstrates that for students to develop competence in "an area of inquiry", they must have three things: 1. "a deep foundation of factual knowledge,"

2. an understanding of “facts and ideas in the context of a conceptual framework,” and 3. the ability to “organize knowledge in ways that facilitate retrieval and application.”

- 3. Integrate the teaching of metacognitive skills into the course and curriculum in multiple areas.** Using metacognitive strategies will assist students in becoming more autonomous learners through clarifying and reflecting on learning goals and their achievement.

### **Helping to Motivate Students to Enhance Learning**

**Summary of practical implications** from Marilla Svinicki. 2004. *Learning and Motivation in the Post-Secondary Classroom*. Anker. (pages 222-235). These principles are based on the ideas and research from several major theories of human learning.

#### **1. Emphasize a Few Key Ideas**

Cognitive Theory suggests that key ideas must be made explicit and stressed in the overall course and each session.

#### **2. Be Aware of Prior Knowledge**

Theories indicate that what students learn is influenced by what they bring to the class. There are various sources of data for this including pretests or prior knowledge surveys given by the instructor.

#### **3. Tap into Motivational Sources**

Think about what motivations students may bring to your course and what you can do to enhance that. Provide reasonable choice and control to students. Help students make connections between what they are learning and their lives. Provide early opportunities for success in the course.

#### **4. Build Structural Knowledge to Achieve Understanding**

Use various strategies to help students see and build interconnections among ideas and/or skills and/or applications in the course. They need an overall, meaningful structure.

#### **5. Structure Learning to Support Encoding of Content**

Use encoding strategies (e.g., organizational encoding, elaboration encoding) to promote “deep: learning.

#### **6. Use Modeling to Teach Skills**

Demonstrate for students the thinking or skills you wish them to learn and practice. Use peers as models as well.

#### **7. Give Lots of Active, Coached Practice**

Provide opportunities for active, hands-on practice with assistance and feedback from faculty and peers.

#### **8. Teach in Ways that Promote Transfer**

Provide opportunities, modeling, and practice for students to apply knowledge and skills to novel situations or problems.

#### **9. Help Students become Aware of their Own Learning Strategies**

Have students use self-analysis and self-reflection to become more aware of how they learn and how they can use that knowledge to improve their learning.

#### **10. Respect Individual Differences in Learning**

Allow flexibility and choice to make diversity in learning an asset.

### **Learning and the Brain**

**Summary of some implications** from J. E. Zull, J. E. 2002. *The Art of Changing the Brain: Enriching the practice of teaching by exploring the biology of learning*. Sterling, VA: Stylus Publishing.

- 1. The importance of connecting learning to students’ prior knowledge.**
- 2. Using emotions appropriately to enhance learning.**
- 3. Varying pedagogy to trigger activity in different parts of the brain.**
- 4. The importance of the the visual sense.**
- 5. Showing students, role-modeling, can be important.**
- 6. The need for active learning- students should “do.”**
- 7. Students should have some control.**
- 8. Students should reflect.**
